

INSTALACIÓN Y CONFIGURACIÓN DE SERVIDORES APACHE Y NGINX

Adrián Aceitón Palomo

30/09/2025

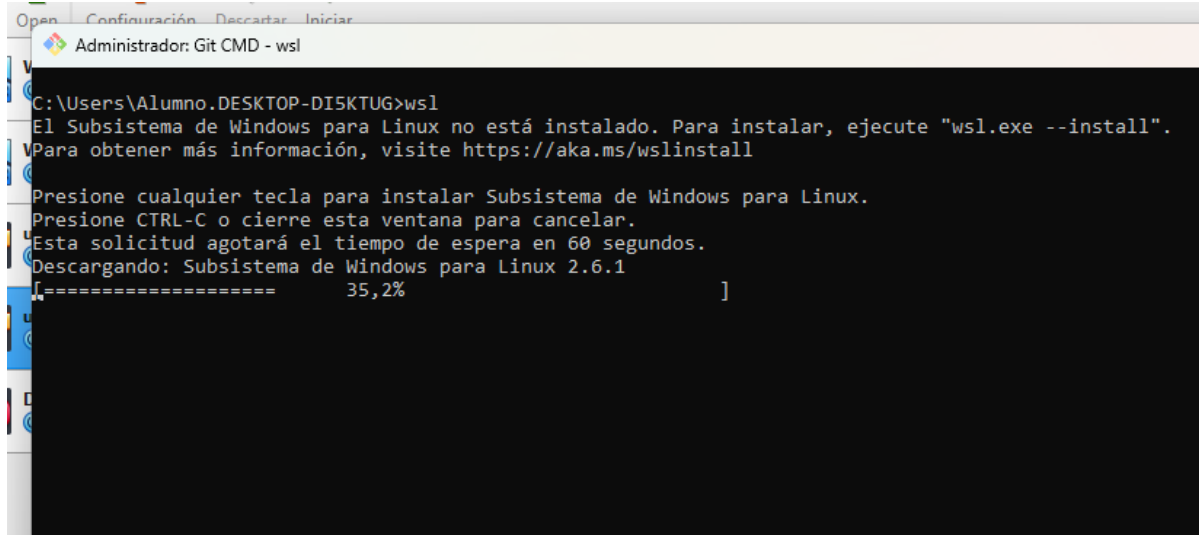

APACHE

NGINX

Instalación de Ubuntu Desktop y algunos servicios: Arquitectura en la nube

Aquí estoy instalando el wsl que simplemente es poner en el Git CMD wsl y darle a cualquier tecla y estaría listo

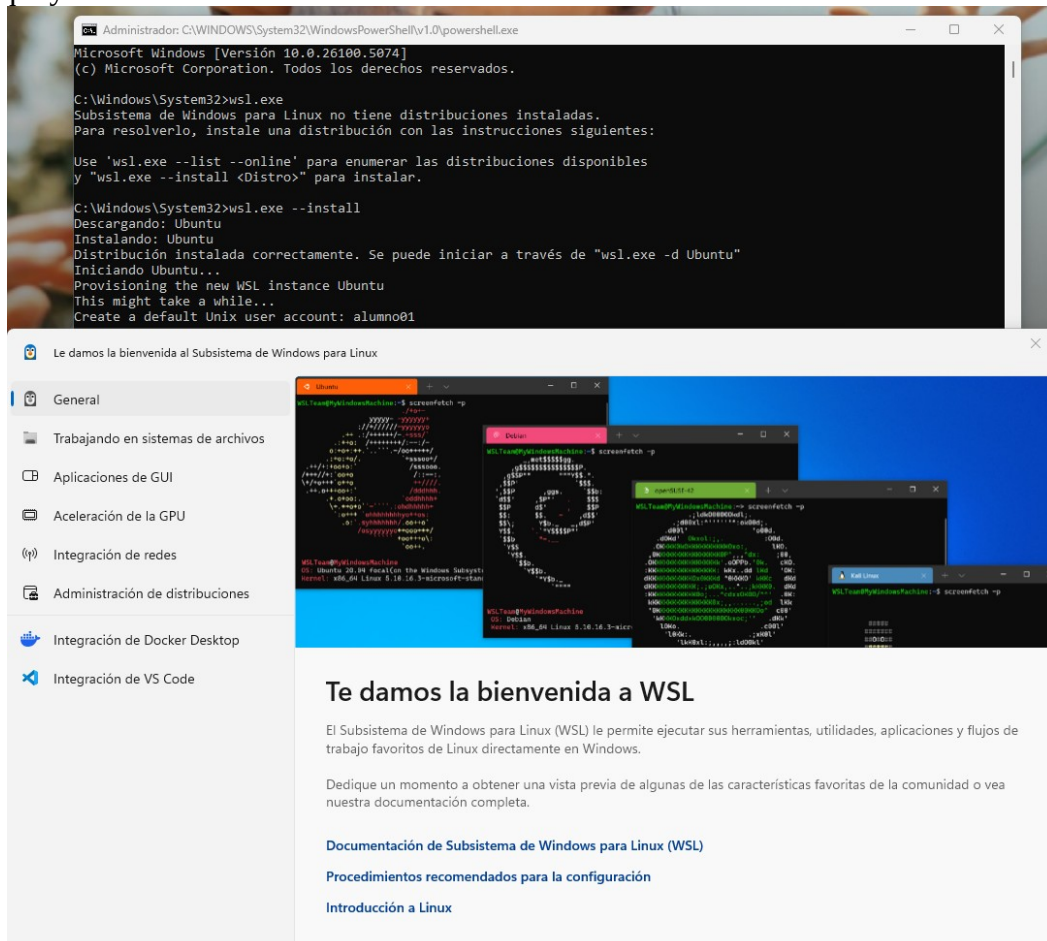

```
Administrador: Git CMD - wsl

C:\Users\Alumno.DESKTOP-DISKTUG>wsl
El Subsistema de Windows para Linux no está instalado. Para instalar, ejecute "wsl.exe --install".
Para obtener más información, visite https://aka.ms/wslinstall

Presione cualquier tecla para instalar Subsistema de Windows para Linux.
Presione CTRL-C o cierre esta ventana para cancelar.
Esta solicitud agotará el tiempo de espera en 60 segundos.
Descargando: Subsistema de Windows para Linux 2.6.1
[===== 35,2% ]
```

Aquí ya está instalado el servicio

```
Administrador: C:\WINDOWS\System32\WindowsPowerShell\v1.0\powershell.exe
Microsoft Windows [Versión 10.0.26100.5874]
(c) Microsoft Corporation. Todos los derechos reservados.

C:\Windows\System32>wsl.exe
Subsistema de Windows para Linux no tiene distribuciones instaladas.
Para resolverlo, instale una distribución con las instrucciones siguientes:

Use 'wsl.exe --list --online' para enumerar las distribuciones disponibles
y "wsl.exe --install <Distro>" para instalar.

C:\Windows\System32>wsl.exe --install
Descargando: Ubuntu
Instalando: Ubuntu
Distribución instalada correctamente. Se puede iniciar a través de "wsl.exe -d Ubuntu"
Iniciando Ubuntu...
Provisioning the new WSL instance Ubuntu
This might take a while...
Create a default Unix user account: alumno01
```

Le damos la bienvenida al Subsistema de Windows para Linux

General

- Trabajando en sistemas de archivos
- Aplicaciones de GUI
- Aceleración de la GPU
- Integración de redes
- Administración de distribuciones
- Integración de Docker Desktop
- Integración de VS Code

Te damos la bienvenida a WSL

El Subsistema de Windows para Linux (WSL) le permite ejecutar sus herramientas, utilidades, aplicaciones y flujos de trabajo favoritos de Linux directamente en Windows.

Dedique un momento a obtener una vista previa de algunas de las características favoritas de la comunidad o vea nuestra documentación completa.

[Documentación de Subsistema de Windows para Linux \(WSL\)](#)

[Procedimientos recomendados para la configuración](#)

[Introducción a Linux](#)

Aquí vemos como ya he creado el usuario y contraseña, también se puede observar que ya estoy con la consola del ubuntu.

```
alumno01@A6Alumno01: /mnt/c/Windows/System32

C:\Windows\System32>wsl.exe
Subsistema de Windows para Linux no tiene distribuciones instaladas.
Para resolverlo, instale una distribución con las instrucciones siguientes:

Use 'wsl.exe --list --online' para enumerar las distribuciones disponibles
y "wsl.exe --install <Distro>" para instalar.

C:\Windows\System32>wsl.exe --install
Descargando: Ubuntu
Instalando: Ubuntu
Distribución instalada correctamente. Se puede iniciar a través de "wsl.exe -d Ubuntu"
Iniciando Ubuntu...
Provisioning the new WSL instance Ubuntu
This might take a while...
Create a default Unix user account: alumno01
New password:
Retype new password:
passwd: password updated successfully
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

SERVIDOR APACHE CON PHP Y ACTUALIZACIÓN DEL SISTEMA Y FICHEROS

Aquí ya he actualizado todo lo que es el ubuntu y sus paquetes con los comandos “sudo apt update && sudo apt upgrade -y”

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt update && sudo apt upgrade -y
[sudo] password for alumno01:
Hit:1 http://archive.ubuntu.com/ubuntu noble InRelease
Get:2 http://security.ubuntu.com/ubuntu noble-security InRelease [126 kB]
Get:3 http://archive.ubuntu.com/ubuntu noble-updates InRelease [126 kB]
Get:4 http://archive.ubuntu.com/ubuntu noble-backports InRelease [126 kB]
Get:5 http://security.ubuntu.com/ubuntu noble-security/main amd64 Packages [1171 kB]
Get:6 http://archive.ubuntu.com/ubuntu noble/universe amd64 Packages [15.0 MB]
Get:7 http://security.ubuntu.com/ubuntu noble-security/main Translation-en [198 kB]
```

Aquí está descargando el servicio apache y el servidor web con el comando “sudo apt install apache2 -y ”

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt install apache2 -y
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following package was automatically installed and is no longer required:
  liblvm19
Use 'sudo apt autoremove' to remove it.
The following additional packages will be installed:
  apache2-bin apache2-data apache2-utils libapr1t64 libaprutil1-dbd-sqlite3 libaprutil1-ldap libaprutil1t64
  liblua5.4-0 ssl-cert
Suggested packages:
  apache2-doc apache2-suexec-pristine | apache2-suexec-custom www-browser ufw
The following NEW packages will be installed:
  apache2 apache2-bin apache2-data apache2-utils libapr1t64 libaprutil1-dbd-sqlite3 libaprutil1-ldap libaprutil1t64
  liblua5.4-0 ssl-cert
0 upgraded, 10 newly installed, 0 to remove and 0 not upgraded.
Need to get 2086 kB of archives.
After this operation, 8090 kB of additional disk space will be used.
Get:1 http://archive.ubuntu.com/ubuntu noble-updates/main amd64 libapr1t64 amd64 1.7.2-3.1ubuntu0.1 [108 kB]
Get:2 http://archive.ubuntu.com/ubuntu noble/main amd64 libaprutil1t64 amd64 1.6.3-1.1ubuntu7 [91.9 kB]
Get:3 http://archive.ubuntu.com/ubuntu noble/main amd64 libaprutil1-dbd-sqlite3 amd64 1.6.3-1.1ubuntu7 [11.2 kB]
```

Esto Instala PHP y su módulo para Apache con el comando “sudo apt install php libapache2-mod-php -y ”

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt install php libapache2-mod-php -y
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following package was automatically installed and is no longer required:
  liblvm19
Use 'sudo apt autoremove' to remove it.
The following additional packages will be installed:
  libapache2-mod-php8.3 php-common php8.3 php8.3-cli php8.3-common php8.3-opcache php8.3-readline
Suggested packages:

Sep 30 09:51:36 A6Alumno01 systemd[1]: Started apache2.service - The Apache HTTP Server.
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Creamos un archivo que muestra información de PHP con el comando: “echo "" | sudo tee /var/www/html/info.php”

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ echo "<?php phpinfo(); ?>" | sudo tee /var/www/html/info.php
<?php phpinfo(); ?>
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Aquí verificamos en el navegador una comprobación del archivo PHP desde la terminal con el comando “curl <http://localhost/info.php>”. Además podemos ver como al darle a “enter” se muestra correctamente toda la página que hemos creado con el anterior comando. También buscando la url en el navegador de nuestro equipo aparecería.

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ curl http://localhost/info.php
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml"><head>
<style type="text/css">

PARTE 2 : COMANDOS NGINX + HTML

Aquí instalaremos Nginx de primeras con el comando: “sudo apt install nginx -y” (abajo detengo Apache).

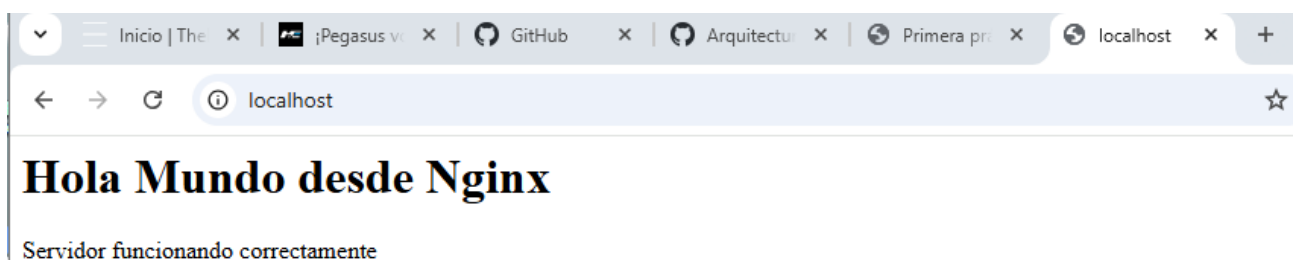

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt install nginx -y
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following package was automatically installed and is no longer required:
  libllvm19
Use 'sudo apt autoremove' to remove it.
The following additional packages will be installed:
```

Luego iniciamos el Nginx previamente instalado con el comando “sudo service nginx start” y tambien verificaremos su estado de funcionamiento con el comando “sudo systemctl status nginx ”. Pero antes de nada debemos apagar el anterior servicio de apache dado que sino va a ocupar el puerto por el que Nginx va a salir (80). comando para apagarlo “sudo service apache2 stop”

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo service apache2 stop
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo service nginx start
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo systemctl status nginx
● nginx.service - A high performance web server and a reverse proxy server
   Loaded: loaded (/usr/lib/systemd/system/nginx.service; enabled; preset: enabled)
   Active: active (running) since Tue 2025-09-30 10:13:07 CEST; 5s ago
     Docs: man:nginx(8)
  Process: 10030 ExecStartPre=/usr/sbin/nginx -t -q -g daemon on; master_process on; (code=exited, status=0/SUCCESS)
  Process: 10031 ExecStart=/usr/sbin/nginx -g daemon on; master_process on; (code=exited, status=0/SUCCESS)
 Main PID: 10033 (nginx)
    Tasks: 17 (limit: 9350)
   Memory: 12.7M (peak: 14.3M)
      CPU: 24ms
   CGroup: /system.slice/nginx.service
           └─10033 "nginx: master process /usr/sbin/nginx -g daemon on; master_process on;"
             └─10034 "nginx: worker process"
               └─10035 "nginx: worker process"
                 └─10036 "nginx: worker process"
                   └─10037 "nginx: worker process"
                     └─10038 "nginx: worker process"
                       └─10039 "nginx: worker process"
                         └─10040 "nginx: worker process"
                           └─10042 "nginx: worker process"
                             └─10043 "nginx: worker process"
                               └─10044 "nginx: worker process"
                                 └─10045 "nginx: worker process"
                                   └─10046 "nginx: worker process"
                                     └─10047 "nginx: worker process"
                                       └─10048 "nginx: worker process"
```

Creamos una pagina HTML simple con el comando: echo "<h1>Hola Mundo desde Nginx</h1><p>Servidor funcionando correctamente</p>" | sudo tee /var/www/html/index.html. Una vez creada lo verificamos desde el navegador a ver si se creó correctamente

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ echo "<h1>Hola Mundo desde Nginx</h1><p>Servidor funcionando correctamente</p>" | sudo tee /var/www/html/index.html
<h1>Hola Mundo desde Nginx</h1><p>Servidor funcionando correctamente</p>
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Ahora vamos a ver la IP de WSL, básicamente vamos a mostrar la IP para acceso desde Windows con el comando: "ip addr show eth0 | grep inet"

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ ip addr show eth0 | grep inet
    inet 172.29.45.224/20 brd 172.29.47.255 scope global eth0
    inet6 fe80::215:5dff:feec:56be/64 scope link
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

PARTE 3: VERIFICACIÓN Y COMPARACIÓN

-Cambiar entre servicios (Apache/Nginx), diferencias entre las páginas servidas por cada servidor, comandos de verificación desde terminal con curl:

Primeramente paro el servicio Nginx con los comandos de la captura y arranco Apache, posteriormente verifico el estado de funcionamiento de Apache.

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo service nginx stop
sudo service apache2 start
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Aquí podemos ver que esta encendido/corriendo Apache.

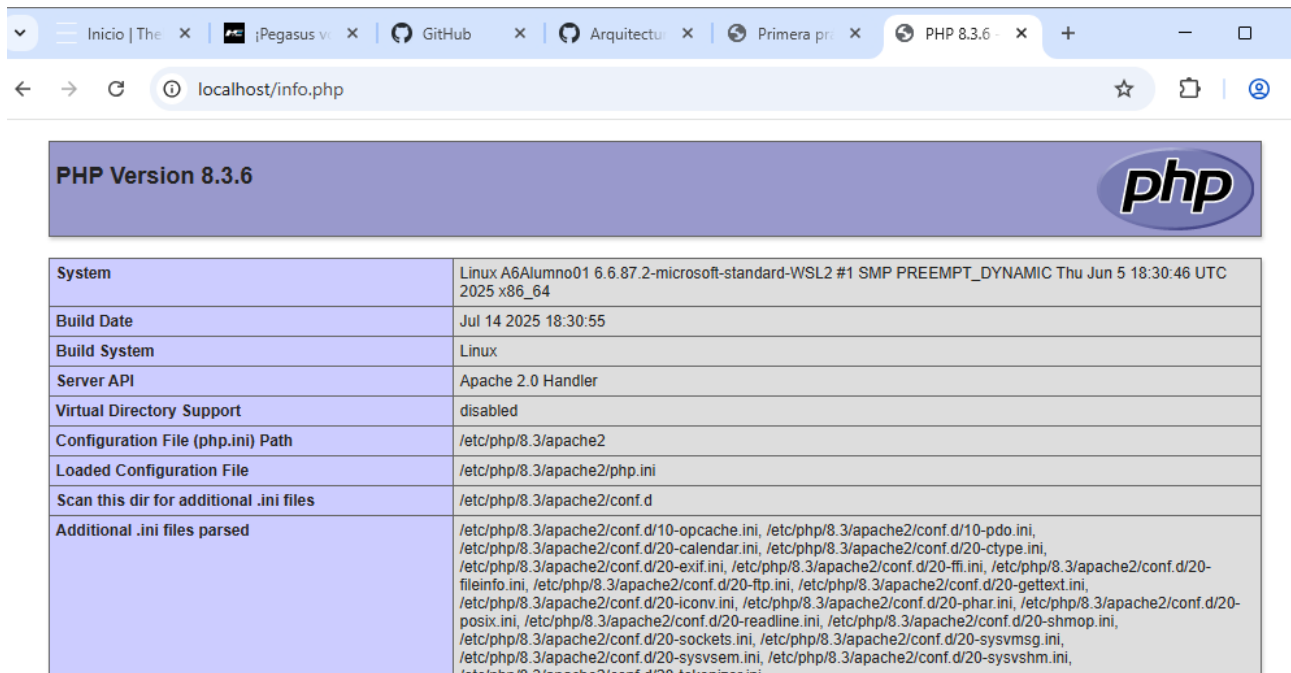

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo systemctl status apache2
● apache2.service - The Apache HTTP Server
   Loaded: loaded (/usr/lib/systemd/system/apache2.service; enabled; preset: enabled)
   Active: active (running) since Tue 2025-09-30 10:30:28 CEST; 1min 18s ago
     Docs: https://httpd.apache.org/docs/2.4/

Sep 30 10:36:30 A6Alumno01 systemd[1]: Started nginx.service - A high performance web server and a reverse proxy server.
lines 1-31/31 (END)
```

Aquí vemos igual que con el PHP que estamos verificando con el comando curl que nos devuelve correctamente la pagina, y también vemos la página web como quedaría en el navegador.

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ curl http://localhost
<h1>Hola Mundo desde Nginx</h1><p>Servidor funcionando correctamente</p>
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Hola Mundo desde Nginx

Servidor funcionando correctamente

-Diferencias entre páginas:

Servidor Apache con archivo PHP:

A screenshot of a web browser window showing the 'PHP Version 8.3.6' page. The page has a purple header with the PHP logo. Below the header is a table with system information. The browser's address bar shows 'localhost/info.php'. The tab bar shows several open tabs, including 'Inicio | The', 'iPegasus v...', 'GitHub', 'Arquitectu...', and 'Primera pr...'. The 'PHP 8.3.6' tab is currently active.

PHP Version 8.3.6	
System	Linux A6Alumno01 6.6.87.2-microsoft-standard-WSL2 #1 SMP PREEMPT_DYNAMIC Thu Jun 5 18:30:46 UTC 2025 x86_64
Build Date	Jul 14 2025 18:30:55
Build System	Linux
Server API	Apache 2.0 Handler
Virtual Directory Support	disabled
Configuration File (php.ini) Path	/etc/php/8.3/apache2
Loaded Configuration File	/etc/php/8.3/apache2/php.ini
Scan this dir for additional .ini files	/etc/php/8.3/apache2/conf.d
Additional .ini files parsed	/etc/php/8.3/apache2/conf.d/10-opcache.ini, /etc/php/8.3/apache2/conf.d/10-pdo.ini, /etc/php/8.3/apache2/conf.d/20-calendar.ini, /etc/php/8.3/apache2/conf.d/20-ctype.ini, /etc/php/8.3/apache2/conf.d/20-exif.ini, /etc/php/8.3/apache2/conf.d/20-ffi.ini, /etc/php/8.3/apache2/conf.d/20-fileinfo.ini, /etc/php/8.3/apache2/conf.d/20-ftp.ini, /etc/php/8.3/apache2/conf.d/20-gettext.ini, /etc/php/8.3/apache2/conf.d/20-iconv.ini, /etc/php/8.3/apache2/conf.d/20-phar.ini, /etc/php/8.3/apache2/conf.d/20-posix.ini, /etc/php/8.3/apache2/conf.d/20-readline.ini, /etc/php/8.3/apache2/conf.d/20-shmop.ini, /etc/php/8.3/apache2/conf.d/20-sockets.ini, /etc/php/8.3/apache2/conf.d/20-sysmsg.ini, /etc/php/8.3/apache2/conf.d/20-sysvsem.ini, /etc/php/8.3/apache2/conf.d/20-sysvshm.ini, /etc/php/8.3/apache2/conf.d/20-tokenizer.ini

Servidor Nginx con archivo HTML básico:

Instalación similar pero con docker

-Primeramente debemos de instalar docker dentro de WSL:

Lo primero que se debe de hacer es actualizar todos los paquetes y archivos.

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt update && sudo apt upgrade -y
```

Paquetes necesarios:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt install -y ca-certificates curl gnupg
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
```

Crear directorio para claves:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo install -m 0755 -d /etc/apt/keyrings
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Descargar la clave oficial de Docker:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg -o /etc/apt/keyrings/docker.asc
```

Ajustar permisos de la clave:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo chmod a+r /etc/apt/keyrings/docker.asc
```

Añadir el repositorio de Docker:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ echo \
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.asc] https://download.docker.com/linux/ubuntu
$(. /etc/os-release && echo ${VERSION_CODENAME}) stable" | \
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Actualizar e instalar Docker Engine, CLI y plugins:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo apt update
sudo apt install -y docker-ce docker-ce-cli containerd.io docker-buildx-plugin docker-compose-plugin
Get:1 https://download.docker.com/linux/ubuntu noble InRelease [48.8 kB]
Get:2 https://download.docker.com/linux/ubuntu noble/stable amd64 Packages [31.1 kB]
```

Comprobar que docker este instalado y su versión:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ docker --version
Docker version 28.4.0, build d8eb465
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

Probar el contenedor de “hello world”

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo docker pull ubuntu
Using default tag: latest
latest: Pulling from library/ubuntu
953cdd413371: Pull complete
Digest: sha256:353675e2a41babd526e2b837d7ec780c2a05bca0164f7ea5dbbd433d21d166fc
Status: Downloaded newer image for ubuntu:latest
docker.io/library/ubuntu:latest
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo systemctl status docker
● docker.service - Docker Application Container Engine
   Loaded: loaded (/usr/lib/systemd/system/docker.service; enabled; preset: enabled)
   Active: active (running) since Tue 2025-09-30 14:46:19 CEST; 12min ago
   TriggeredBy: ● docker.socket
     Docs: https://docs.docker.com
    Main PID: 2543 (dockerd)

        CPU: 2.636s
     CGroup: /system.slice/docker.service
             └─2543 /usr/bin/dockerd -H fd:// --containerd=/run/containerd/containerd.sock

Sep 30 14:46:19 A6Alumno01 dockerd[2543]: time="2025-09-30T14:46:19.578403000+02:00" level=info msg="Creating a containerd client" address=/run/containerd/containerd.sock
Sep 30 14:46:19 A6Alumno01 dockerd[2543]: time="2025-09-30T14:46:19.661834300+02:00" level=info msg="Loading containers: start."
```

docker info:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ docker info
Client: Docker Engine - Community
Version: 28.4.0
Context: default
Debug Mode: false
Plugins:
ai: Docker AI Agent - Ask Gordon (Docker Inc.)
Version: v1.9.11
Path: /usr/local/lib/docker/cli-plugins/docker-ai
buildx: Docker Buildx (Docker Inc.)
Version: v0.28.0-desktop.1
Path: /usr/local/lib/docker/cli-plugins/docker-buildx
cloud: Docker Cloud (Docker Inc.)
Version: v0.4.29
Path: /usr/local/lib/docker/cli-plugins/docker-cloud
compose: Docker Compose (Docker Inc.)
```

docker ps:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ docker ps -a
CONTAINER ID   IMAGE     COMMAND   CREATED   STATUS    PORTS     NAMES
alumno01@A6Alumno01:/mnt/c/Windows/System32$
```

docker corriendo ya:

```
alumno01@A6Alumno01:/mnt/c/Windows/System32$ sudo docker run -it ubuntu /bin/bash
root@86e99cf73cea:/# docker exec -it CONTAINER_ID /bin/bash
bash: docker: command not found
root@86e99cf73cea:/#
```

Ahora vamos con el servicio NGINX y APACHE dentro del docker que esta dentro de WSL:

Primeramente hemos instalado apache y nginx con el “sudo apt install nginx” -y y “sudo apt install apache2”

```
root@ab196fc50848:/# apt install nginx -y
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
```

luego hacemos lo mismo con apache y con php, los instalamos. Con el comando echo igual que en nginx creamos el archivo y luego con curl lo comprobamos

```
root@ab196fc50848:/# apt install php libapache2-mod-php -y
Reading package lists... Done
```

Hacemos correr el servicio apache2 y tambien verificamos que el servicio funcione (este comando en docker es diferente al de wsl):

```
root@ee7307a500ce:/# service apache2 start
* Starting Apache httpd web server apache2
*
```

Ahora instalamos curl y comprobamos que apache funcione.

```
root@ee7307a500ce:/# apt install curl -y
Reading package lists... Done
Calculating upgrade... Done
0 upgraded, 0 newly installed, 0 to remove and 0 not upgraded.
root@ab196fc50848:/# service apache2 start
* Starting Apache httpd web server apache2
*
root@ab196fc50848:/# service apache2 status
* apache2 is running
root@ab196fc50848:/#
```

Aquí básicamente hay varias cosas, he instalado nginx, he parado el servicio de apache, he iniciado el servicio de nginx, después he metido el “echo” para nginx y he probado con el comando “curl http://localhost”.

Ahora con el comando curl lo comprobamos.

```
Setting up libpam-cap:amd64 (1:2.66-5ubuntu2.2) ...
debconf: unable to initialize frontend: Dialog
debconf: (No usable dialog-like program is installed, so the dialog based frontend cannot run. See the debconf documentation at /usr/share/perl5/Debconf/FrontEnd/Dialog.pm line 79.)
debconf: falling back to frontend: Readline
Setting up libbpf1:amd64 (1:1.3.0-2build2) ...
Setting up iproute2 (6.1.0-1ubuntu6.2) ...
debconf: unable to initialize frontend: Dialog
debconf: (No usable dialog-like program is installed, so the dialog based frontend cannot run. See the debconf documentation at /usr/share/perl5/Debconf/FrontEnd/Dialog.pm line 79.)
debconf: falling back to frontend: Readline
Setting up nginx (1.24.0-2ubuntu7.5) ...
Not attempting to start NGINX, port 80 is already in use.
Processing triggers for libc-bin (2.39-0ubuntu8.6) ...
root@ab196fc50848:/# service nginx status
* nginx is not running
root@ab196fc50848:/# echo "<h1>Hola Mundo desde NGINX</h1><p>Servidor funcionando correctamente</p>" | tee /var/www/html/index.html
<h1>Hola Mundo desde NGINX</h1><p>Servidor funcionando correctamente</p>
root@ab196fc50848:/# service apache2 status
* apache2 is running
root@ab196fc50848:/# service apache2 stop
* Stopping Apache httpd web server apache2
*
root@ab196fc50848:/# service nginx start
* Starting nginx nginx
root@ab196fc50848:/# service nginx service
Usage: nginx {start|stop|restart|reload|force-reload|status|configtest|rotate|upgrade}
root@ab196fc50848:/# service nginx status
* nginx is running
root@ab196fc50848:/# curl http://localhost
<h1>Hola Mundo desde NGINX</h1><p>Servidor funcionando correctamente</p>
root@ab196fc50848:/#
```

Aquí he hecho lo mismo que en el nginx, básicamente bajo el servicio de nginx, inicio el apache y compruebo con curl que funcione

```

root@ab196fc5084b: /#
```

Ahora comprobamos desde el navegador del PC si funcionan los dos servicios.
